# **Quantum Mechanics** Fall 2019

Yuxuan Zhang, XJTU, 2160909016

Important equations and constants

### Schrödinger equation

$$\begin{split} i \overline{h} \frac{\partial}{\partial t} \Psi(x,t) &= -\frac{\overline{h}^2}{2m} \frac{\partial^2}{\partial x^2} \Psi(x,t) + V \Psi \\ \overline{h} \frac{\partial}{\partial t} \Psi &= H \Psi \end{split}$$

## Hamiltonian operator

$$H = -\frac{\overline{h}^2}{2m}\nabla^2 + V$$

# Week 1

Get into the quntum world

Notes on Lesson 1 Monday Sep 2

Notes on Lesson 2 Tuesday Sep 3

**Bohr-Sommerfeld Quantization (Old quantum theory)** 

$$\oint p \, dq = nh$$

While p is the momentum of a particle, which is a function of position of particle q. This equation constrains the movement of a particle in a specific potential field V(q).

Notes on Lesson 3 Friday Sep 6

#### **Born Statistical Interpretation of Wave Function**

The wave function  $\Psi(x,t)$  discribes the "Amplitude" of the probability finding the paticle at coordinate(x,t). While the probability density equals amplitude squared.

That is, the probability finding the particle among  $x \in [a, b]$  at time  $t_0$  is discribed as:

$$P(x \in [a, b], t = t_0) = \int_a^b |\psi|^2 dx = \int_a^b \psi^* \psi dx$$

Or, to say, the Probability Density can be written as:

$$p(x,t) = |\psi(x,t)|^2 = \psi^*(x,t)\psi(x,t)$$

# Homework

[week1 hw1]

• Problem 1 - [Thinking][Optional] A Brief History of Clues

PENDING: This part will be done later this week.

• Problem 2 - Caculate wave length of an electron after a 1000V potential field

Utilizing *de Broglie wave* equation (ignoring relativity effect):

Energy obtained by this electron :  $E = q \cdot U = 1000 \, eV$ 

Corresponding momentum of this electron:  $p = \sqrt{2m \cdot E}$ 

Wave length of this electorn:  $\lambda = \frac{h}{n}$ 

 $=\frac{6.626\times10^{-34}}{\sqrt{2\times9.1\times10^{-31}\times1000\times1.6\times10^{-19}}}$ 

 $=3.88 \times 10^{-9} \, m$ 

• Problem 3 - Derivation of Klein-Gordon equation

PENDING: This part will be done later this week.

[week1 hw2]

- Problem 4 Griffiths 1.2
- (a) Find the standard deviation of the distribution in Example 1.1.

First caculate the probability of finding this object at position x, represented by  $\rho(x)$ :

$$total\; travel\; time\; T = \sqrt{\frac{2\;h}{g}}$$

$$dt = \frac{dx}{v} = \frac{1}{\sqrt{2gx}} \, dx$$

$$\rho(x) = \frac{dt}{T \, dx} = \frac{1}{2\sqrt{hx}}$$

Accoring to statistics:

$$\langle x \rangle^2 = \left( \int_0^h x \cdot \rho(x) \, dx \right)^2$$
$$= \left( \int_0^h \frac{x}{2\sqrt{hx}} \, dx \right)^2$$
$$= \frac{h^2}{9}$$

$$\langle x^2 \rangle = \int_0^h x^2 \cdot \rho(x) \, dx$$
$$= \int_0^h \frac{x^2}{2\sqrt{hx}} \, dx$$
$$= \frac{h^2}{5}$$

Hence:

$$\delta = \sqrt{\langle x^2 \rangle - \langle x \rangle^2}$$
$$= \frac{2}{3\sqrt{5}} h$$

(b) What is the probability that a photograph, selected at ramdom, would show a distance x more than one standard deviation away from the average?

We have known that the average is  $\langle x \rangle = \frac{h}{3}$ , and the standard deviation is  $\delta = \frac{2}{3\sqrt{5}}h$ . We now want to know the probability of finding x among  $0 < x < \langle x \rangle - \delta$  or  $\langle x \rangle + \delta < x < h$ :

$$P = \int_0^{\langle x \rangle - \delta} \rho(x) \, dx + \int_{\langle x \rangle + \delta}^h \rho(x) \, dx$$

$$= 1 - \int_{\langle x \rangle - \delta}^{\langle x \rangle + \delta} \rho(x) \, dx$$

$$= 1 - \frac{1}{\sqrt{h}} \left( \sqrt{x} \Big|_{\frac{5 + 2\sqrt{5}}{15} h}^{\frac{5 + 2\sqrt{5}}{15} h} \right)$$

$$= 1 - \left( \sqrt{\frac{5 + 2\sqrt{5}}{15}} - \sqrt{\frac{5 - 2\sqrt{5}}{15}} \right)$$

$$\approx 0.39$$

#### • Problem 5 - Griffiths 1.4

At time t = 0 a particle is represented by the wave function

$$\Psi(x,0) = \begin{cases} A\frac{x}{a}, & if \ 0 \le x \le a, \\ A\frac{(b-x)}{(b-a)}, & if \ a \le x \le b, \\ 0, & otherwise, \end{cases}$$

where A, a and b are constants.

(a) Normalize  $\Psi$  (that is, find A in terms of a and b)

The integral of  $|\Psi|^2$  in all space is:

$$\int_{-\infty}^{+\infty} \Psi^* \Psi \, dx = \int_0^a A^2 \frac{x^2}{a^2} \, dx + \int_a^b A^2 \frac{(b-x)^2}{(b-a)^2} \, dx$$

$$= A^2 \left( \frac{a}{3} + \frac{b-a}{3} \right)$$

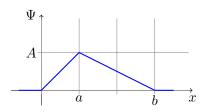

$$= \frac{1}{3} Ab$$
= 1

Hence:

$$A = \sqrt{\frac{3}{b}}$$

(b) Sketch  $\Psi(x,0)$ , as a function of x.

Let 
$$a = 1$$
,  $b = 3 \Rightarrow A = 1$ :

(c) Where is the particle most likely to be found, at t = 0?.

Obviously, at x = a.

(d) What is the probability of finding the particle to the left of a? Check your result in the limiting cases b=a and b=2a.

In case of b = a:

$$A = \sqrt{\frac{3}{b}} = \sqrt{\frac{3}{a}}$$

$$P = \int_0^a \frac{3}{a} \left(\frac{x}{a}\right)^2 dx = 1$$

In case of b = 2a:

$$A = \sqrt{\frac{3}{b}} = \sqrt{\frac{3}{2a}}$$

$$P = \int_0^a \frac{3}{2a} \left(\frac{x}{a}\right)^2 dx = \frac{1}{2}$$

(e) What is the expectation value of x?

$$\begin{split} \langle x \rangle &= \frac{3}{b} \left( \int_0^a x \cdot \frac{x^2}{a^2} \, dx + \int_a^b x \cdot \frac{(b-x)^2}{(b-a)^2} \, dx \right) = \frac{3}{b} \left( \frac{a^2}{4} + \frac{b^4 - 3a^4 + 8a^3b - 6a^2b^2}{12 \, (b-a)^2} \right) \\ &= \frac{3a^2 (b-a)^2 + b^4 - 3a^4 + 8a^3b - 6a^2b^2}{4b \, (b-a)^2} = \frac{3a^4 + 3a^2b^2 - 6a^3b + b^4 - 3a^4 + 8a^3b - 6a^2b^2}{4b \, (b-a)^2} \\ &= \frac{b(b^3 + 2a^3 - 3a^2b)}{4b \, (b-a)^2} = \frac{(b-a)^{\frac{1}{3}} + 3a(b-a)^2}{4(b-a)^2} = \frac{2a+b}{4} \end{split}$$

# **Notes on Lesson 1**

Measurements and Operators - Monday Sep 9

Starting with the most basic measurable value: expectation value of position  $\langle x \rangle$ 

$$\langle x \rangle = \int x \, \rho(x) \, dx = \int \psi^* \, x \, \psi \, dx$$

Then consider  $\langle x \rangle$  change with time:

$$\frac{d}{dt} < x > = \frac{d}{dt} \int \Psi^* x \, \Psi \, dx \tag{1}$$

$$= \int x \frac{\partial}{\partial t} |\Psi|^2 \, dx \tag{2}$$

$$= \int x \left( \frac{\partial \Psi^*}{\partial t} \Psi + \frac{\partial \Psi}{\partial t} \Psi^* \right) dx \tag{3}$$

$$SchrdingerEq \Rightarrow i\overline{h} \frac{\partial}{\partial t} \Psi = -\frac{\overline{h}^2}{2m} \frac{\partial}{\partial x^2} \Psi + V \Psi$$
 (4)

$$-i\overline{h}\,\frac{\partial}{\partial t}\Psi^* = -\frac{\overline{h}^2}{2m}\,\frac{\partial}{\partial x^2}\Psi^* + V\Psi^* \tag{5}$$

Conclude to 
$$\Rightarrow \frac{\partial \Psi}{\partial t} \cdot \Psi^* = +\frac{i\overline{h}}{2m} \frac{\partial}{\partial x^2} \Psi \cdot \Psi^* + \frac{V}{i\overline{h}} \Psi \cdot \Psi^*$$
 (6)

$$\frac{\partial \Psi^*}{\partial t} \cdot \Psi = -\frac{i\overline{h}}{2m} \frac{\partial}{\partial x^2} \Psi^* \cdot \Psi - \frac{V}{i\overline{h}} \Psi^* \cdot \Psi \tag{7}$$

$$= \frac{i\overline{h}}{2m} \int x \cdot \left( \Psi^* \frac{\partial^2}{\partial x^2} \Psi - \Psi \frac{\partial^2}{\partial x^2} \Psi^* \right) dx \tag{8}$$

$$Math\ tricks \Rightarrow (u\,\ddot{v} - v\,\ddot{u}) = \frac{d}{dx}\,(u\,\dot{v} - v\,\dot{u}) \tag{9}$$

$$= \frac{i\overline{h}}{2m} \int x \cdot \frac{\partial}{\partial x} \left( \Psi^* \frac{\partial}{\partial x} \Psi - \Psi \frac{\partial}{\partial x} \Psi^* \right) dx \tag{10}$$

Using integral by part  $\Rightarrow u \cdot dv = uv - v \cdot du$  (11)

$$let \Rightarrow u = x \tag{12}$$

$$v = \Psi^* \frac{\partial}{\partial x} \Psi - \Psi \frac{\partial}{\partial x} \Psi^* \tag{13}$$

$$We \ get \Rightarrow$$
 (14)

$$x \cdot d\left(\Psi^* \frac{\partial}{\partial x} \Psi - \Psi \frac{\partial}{\partial x} \Psi^*\right) = u \cdot dv = u \cdot v - v \cdot du = -\left(\Psi^* \frac{\partial}{\partial x} \Psi - \Psi \frac{\partial}{\partial x} \Psi^*\right) dx \tag{15}$$

$$= -\frac{i\hbar}{2m} \int \left( \Psi^* \frac{\partial}{\partial \mathbf{x}} \Psi - \Psi \frac{\partial}{\partial \mathbf{x}} \Psi^* \right) d\mathbf{x} \tag{16}$$

Using integral by part again  $\Rightarrow u \cdot dv - v \cdot du = -uv + 2u \cdot dv$  (17)

$$let \Rightarrow u = \Psi^* \tag{18}$$

$$v = \Psi \tag{19}$$

$$We \ get \Rightarrow \Psi^*\partial\Psi - \Psi\partial\Psi^* = u \cdot dv - v \cdot du = \Psi^*\partial\Psi + 2v \cdot du = 2\Psi^*\partial\Psi = 2\Psi^*\frac{\partial}{\partial x}\Psi \ dx \tag{20}$$

$$= -\frac{i\overline{h}}{2m} \int \mathfrak{L} \cdot \Psi^* \frac{\partial}{\partial x} \Psi \, dx \tag{21}$$

$$= \int \Psi^* \left( -\frac{i\overline{h}}{m} \frac{\partial}{\partial x} \right) \Psi \, dx \tag{22}$$

Now we can find a new operator: momentum  $\hat{p}$ 

$$\label{eq:p} = m \frac{d < x >}{dt} = \int \Psi^* \left( -i \overline{h} \, \frac{\partial}{\partial x} \right) \Psi \, dx = \int \Psi^* \bigg( \frac{\overline{h}}{i} \cdot \frac{\partial}{\partial x} \bigg) \Psi \, dx$$

Additional proof of  $\; \frac{\partial}{\partial t} \int |\Psi|^2 \, dx = 0 \;$ 

$$\frac{d}{dt} \int |\Psi|^2 dx = \int \frac{\partial}{\partial t} |\Psi|^2 dx \tag{23}$$

$$= \int \frac{\partial}{\partial t} \left( \Psi^* \Psi \right) \, dx \tag{24}$$

$$= \int \left( \Psi^* \frac{\partial}{\partial t} \Psi + \Psi \frac{\partial}{\partial t} \Psi^* \right) dx \tag{25}$$

$$SchrdingerEq \Rightarrow \frac{\partial}{\partial t}\Psi = \frac{i\overline{h}}{2m}\frac{\partial}{\partial x^2}\Psi - \frac{i}{\overline{h}}V\Psi$$
 (26)

$$\frac{\partial}{\partial t}\Psi^* = -\frac{i\overline{h}}{2m}\frac{\partial}{\partial x^2}\Psi^* + \frac{i}{\overline{h}}V\Psi^*$$
 (27)

$$= \int \frac{i\overline{h}}{2m} \left( \Psi^* \frac{\partial^2 \Psi}{\partial x^2} - \Psi \frac{\partial^2 \Psi^*}{\partial x^2} \right) dx \tag{28}$$

$$=\frac{i\overline{h}}{2m}\int \frac{\partial}{\partial x} \left(\Psi^* \frac{\partial \Psi}{\partial x} - \Psi \frac{\partial \Psi^*}{\partial x}\right) dx \tag{29}$$

$$= \frac{i\overline{h}}{2m} \left( \Psi^* \frac{\partial \Psi}{\partial x} - \Psi \frac{\partial \Psi^*}{\partial x} \right) \Big|_{-\infty}^{+\infty}$$
 (30)

Note that 
$$\Psi$$
 is normalizable  $\Rightarrow \lim_{x\to\infty} \Psi = 0$  (31)

$$\Rightarrow \lim_{x \to \infty} \frac{\partial \Psi}{\partial x} = 0 \tag{32}$$

$$=0 (33)$$

$$\Rightarrow Proved$$
 (34)
